Kawasaki Robot
Kawasaki Common Offline NC Data Generator
KCONG  Automatic robot teaching software

CAUTIONS TO BE TAKEN TO ENSURE SAFETY

For those persons involved with the operation/service of your system, including Kawasaki Robot, they must strictly observe all safety regulations at all times. They should carefully read the Manuals and other related safety documents.

Products described in this catalogue are general industrial robots. Therefore, if a customer wishes to use the Robot for special purposes, which might endanger operators or if the Robot has any problems, please contact us. We will be pleased to help you.

Be careful as Photographs illustrated in this catalogue are frequently taken after removing safety fences and other safety devices stipulated in the safety regulations from the Robot operation system.

Kawasaki Robot

ISO certified in Wixom, Michigan U.S.A.
There are a number of issues involved in implementing and leveraging robot systems. In addition to requiring a high level of knowledge and expertise, a large amount of time must be set aside for robot teaching. "KCONG", the automatic robot teaching software offered by Kawasaki, effectively eliminates these issues. Using 3D CAD data of workpieces, KCONG automatically creates robot operation programs that radically improve the efficiency of robots and make them more economical.

**Features**

**Easy operation**
KCONG makes it easy for users with no knowledge of robots to quickly create robot operation data on the 3D CAD screen.

**Seamless environment for all phases**
KCONG accepts 3D design data (CAD data) as is and automatically converts it into robot operation data (CAM data). This allows you to build a seamless environment for all phases, from design all the way through to production.

**Preliminary verification**
KCONG uses a robot simulator to simulate the in-field operations, making it easy for you to check for collision and adjust devices.

**High extensibility**
You can freely expand the software system by adding optimum application packages specifically tailored to your onsite needs and processes.

This software significantly reduces the time needed for robot teaching and lowers production costs.

KCONG uses 3D CAD data to automatically create a robot operation program.

- **Robot teaching: Essential to getting the most out of your robots**
  An important part of creating operation programs for industrial robots is the teaching process. This involves moving the robot and having the controller sequentially memorize the robot’s position, operations, and coordinates. To complete the program, repeat verification is performed by playing back the program on the robot and making the necessary adjustments.

- **Problems with offline teaching**
  Offline teaching normally involves using robot and workpiece images displayed on screen instead of the actual robot. However, entering the data for complicated robot movements is no simple task, which means a high level of skill is needed to operate the robot and create a program. In addition, it often takes several weeks to write a large-scale program. Creating a program for diversified products in limited quantities also pose a major challenge to users.

**KCONG provides the solution!**
KCONG solves the problems with offline teaching. Using 3D CAD data, KCONG automatically creates a robot operation program in a relatively short amount of time, with no need to perform the conventional teaching process. It also delivers simulation capabilities that allow for easy verification and adjustment. KCONG enables engineers with no expertise in robotics to promote the use of robot systems, while reducing the teaching time and lowering production costs.
Automatic creation of an operation program

KCONG can accept any 3D CAD data available for general use and convert it into the data needed to automatically create a robot operation program. This makes it possible to implement CAD data and robot environments that seamlessly connect the design department with the production site.

KCONG system configuration

CAD data
- ACIS
- CATIA*1
- IGES
- Parasolid
- Unigraphics
- Mechanical Desktop

Conversion

Construction path generation engine
- Process route setup
- Construction condition database

Teaching point generation engine
- Process condition setup
- Automatic creation of an operation program
- Operation pattern database
- Robot movement check
- Interference check

Robot simulator

Robot controller
- Execution of robot operation

Automation of various processes

KCONG comes with application software that supports a variety of functions, such as welding, painting, and deburring. These functions, which make full use of the technologies and expertise Kawasaki has cultivated on the production floor, enable users to create operation programs quickly and easily. All that needs to be done is simply select the working positions and processes on the 3D CAD screen displaying the workpieces.

- Chamfering / Deburring
- Painting
- Milling
- Cutting
- Welding
- Trimming

KCONG accepts existing CAD data on an “as is” basis!
**Easy operation for first-time users**

KCONG features an intuitive graphical user interface (GUI). Using this GUI, first-time users can quickly begin working with KCONG shortly after it is installed, with no need for any special training.

**Reduced teaching time and lower production costs**

KCONG reduces the time needed for conventional offline teaching and adjustment by up to a factor of ten! The time savings and enhanced efficiency achieved by KCONG help to significantly lower costs. In addition, KCONG is less expensive to implement than the average general-purpose offline programming system.

**KCONG operation screens**

- **Workpiece shape design**
  For KCONG users who already have a 3D CAD system, data from the system can be accepted as is. (In some cases, prior verification may be required for data conversion.) KCONG users that do not have a 3D CAD system can use KCONG's CAD function (standard feature of SolidWorks®) to design the shape of each workpiece.

- **Automatic creation of operation programs (teaching points)**
  From the CAD screen, the user selects which part of the workpiece they want to process and then enters the process data. The user can also select robot operation patterns from the database. After entering the process data, all the user needs to do is simply press the button to automatically create the operation data. There is also the automatic orientation setup function, which is available as an option. Using this option, the user can automatically set up the optimum orientation of a complex robot that has an external axis.

- **Robot simulation**
  After an operation program is automatically created, it is checked using the robot simulator. Users can verify the robot operations by watching animated sequences that reproduce virtual representations of the robots and workpieces. The simulator also checks for collision, helps to prevent faults, and allows users to fine adjust the portions to be processed.

- **Editing teaching points**
  After the operations are verified and the necessary adjustments are made, the final edit is performed. After this edit, the completed operation program is downloaded to the robot controller.

- **Robot operation**

  - Small-scale workpieces and intricately shaped workpieces that are difficult to robotize

- **Manual operation**

  - Internal operation

- **Enhanced efficiency with KCONG**
